Digital integrated circuits a design perspective 3rd edition

(NOTE: Each chapter begins with an Introduction and concludes with a Summary, To Probe Further, and Exercises and Design Problems.) I. THE FABRICS. A Historical Perspective. Issues in Digital Integrated Circuit Design. Quality Metrics of a Digital Design. 2. The Manufacturing Process. The CMOS Manufacturing Process. Design Rules—The Contract between Designer and Process Engineer. Packaging Integrated Circuits. Perspective—Trends in Process Technology. The Diode. The MOS(FET) Transistor. A Word on Process Variations. Perspective: Technology Scaling. A First Glance. Interconnect Parameters—Capitance, Resistance, and Inductance. Electrical Wire Models. SPICE Wire Models. Perspective: A Look into the Future. II. A CIRCUIT PERSPECTIVE. The Static CMOS Inverter—An Intuitive Perspective. Evaluating the Robustness of the CMOS Inverter: The Static Behavior. Performance of CMOS Inverter: The Dynamic Behavior. Power, Energy, and Energy-Delay. Perspective: Technology Scaling and Its Impact on the Inverter Metrics. 6. Designing Combinational Logic Gates in CMOS. Static CMOS Design. Dynamic CMOS Design. How to Choose a Logic Style? Perspective: Gate Design in the Ultra Deep-Submicron Era. 7. Designing Sequential Logic Circuits. Timing Metrics for Sequential Circuits. Classification of Memory Elements. Static Latches and Registers. Dynamic Latches and Registers. Pulse Registers. Sense-Amplifier Based Registers. Pipelining: An Approach to Optimize Sequential Circuits. Non-Bistable Sequential Circuits. Perspective: Choosing a Clocking Strategy. III. A SYSTEM PERSPECTIVE. 8. Implementation Strategies for Digital ICS. From Custom to Semicustom and Structured-Array Design Approaches. Custom Circuit Design. Cell-Based Design Methodology. Array-Based Implementation Approaches. Perspective—The Implementation Platform of the Future. 9. Coping with Interconnect. Capacitive Parasitics. Resistive Parasitics. Inductive Parasitics. Advanced Interconnect Techniques. Perspective: Networks-on-a-Chip. 10. Timing Issues in Digital Circuits. Timing Classification of Digital Systems. Synchronous Design—An In-Depth Perspective. Self-Timed Circuit Design. Synchronizers and Arbiters. Clock Synthesis and Synchronization Using a Phased-Locked Loop. Future Directions and Perspectives. 11. Designing Arithmetic Building Blocks. Datapaths in Digital Processor Architectures. The Adder. The Multiplier. The Shifter. Other Arithmetic Operators. Power and Spped Trade-Offs in Datapath Structures. Perspective: Design as a Trade-off. 12. Designing Memory and Array Structures. The Memory Core. Memory Peripheral Circuitry. Memory Reliability and Yield. Power Dissipation in Memories. Case Studies in Memory Design. Perspective: Semiconductor Memory Trends and Evolutions. Welcome to the home of "Digital Integrated Circuits", a dynamic companion to a similarly named book published by Prentice-Hall. The book is intended for use in a senior/graduate level digital circuit design class, but also presents a state-of-the-art reference for professional engineers. Besides providing a solid, in-depth analysis of the operation of digital gates, it addresses the compelling issues facing the modern digital circuit designer such as performance optimization, power minimization, interconnect, packaging, timing synchronization, and the impact of design automation. Click here for a table of contents. This homepage offers extra homework exercises, challenging design problems, companion software tools, instructor material and errata. It is our hope that the offered selection will grow over time as a result of reader contributions. WARNING: Reproduction of the material presented in this home page for class or personal use is encouraged. For commercial use, permission should be obtained from the author. Important Notice: A 2nd Edition of the text book is expected to be on the shelves by the end of September 2002. Please check the new web-page for more information. What does the Home Page offer? Click on icon for more info. Device Models and New Problem Sets. Complete Design Projects. Lab descriptions. Instructor material, including a full transparency set. A comprehensive set of down-loadable digital IC design tools. Errata, Corrections, Discussions and Comments. Other web-sites, publications or references of interest. Back to the top of the page. Summary Of The Book Digital Integrated Circuits: A Design Perspective provides a comprehensive coverage of the implementation strategies and new design methodologies of digital integrated circuits. This text also talks about the new issues that impact performance, power dissipation, cost, and reliability of chips that are now as small as 100nm. This translates as increased importance in designing circuits, while considering deep submicron transistor effects, interconnect, low-power design and high-performance, and timing as well as clock distribution. This text, unlike the first edition, focuses completely on CMOS ICs. Although new changes have been introduced in this edition, the core aspects of the earlier edition, such as the goal and spirit of the text, have been left untouched. Digital Integrated Circuits: A Design Perspective opens with a discussion on the operation of electronic devices and a detailed analysis of the inverter, considered the nucleus of digital design. The text then flows into the design of modules such as adders, controllers, gates, memories, and multipliers. There are three parts to the text, namely The Fabrics, A Circuit Perspective, and A System Perspective, and a total of twelve chapters contained within them. Each chapter of the text also contains numerous examples and brain teasers or exercise problems that helps the reader think about and understand the material better. The chapters are fed with actual design layouts and examples to aid the readers' understanding. Solved design problems can be accessed by the readers on the website . This text is intended for use by undergraduate and postgraduate students of electronics studying digital circuit design. About The Authors Jan M. Rabaey is a Professor at Electrical Engineering and Computer Sciences College of Engineering, University of California, Berkeley. Jan graduated from the Katholieke Universiteit Leuven, Belgium, with EE and Ph.D degrees. He then took up a number of research positions across universities and finally joined the faculty at EECS department at UC Berkeley, where he currently holds a distinguished professorship. His research areas include communications and networking, energy, design, modeling and analysis, signal processing, and integrated circuits. Signal Processing Society Senior Award and the Presidential Young Investigator award are among his awards. Anantha Chandrakasan is a Professor of Electrical Engineering at the Massachusetts Institute of Technology, Cambridge. He is the author of Design of High-Performance Microprocessor Circuits and Low Power CMOS Design. Anantha graduated from the University of California, Berkeley, studying electrical engineering and computer sciences and receiving BS, MS, and Ph.D degrees. His areas of interest are wireless microsensor system design, energy efficient radios, and portable multimedia devices. He is the recipient of the DAC Design Contest Award, ISSCC Beatrice Winner Award for Editorial Excellence, and IEEE Donald O. Pederson Award. Borivoje Nikoli? is a Professor at Electrical Engineering and Computer Sciences College of Engineering, University of California, Berkeley. Borivoje graduated from the University of Belgrade, Serbia with Dipl.Ing. and M.Sc. degrees in electrical engineering. He then went on to study at the University of California at Davis and received his Ph.D degree. His research interests include signal processing algorithms and communications and analog and digital integrated circuit design. error: Content is protected !!
